MIT STAMP Workshop 2021

Agenda

- Motivations
- Analysis
- Key findings
- Summary & Acknowledgement

Motivations

To understand:

- How STPA can be applied for Socio-Technical Systems.
- How we could have improved the responses and save more lives.

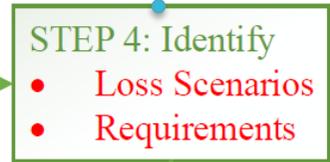

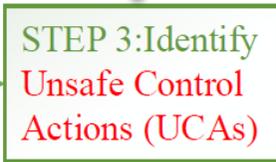

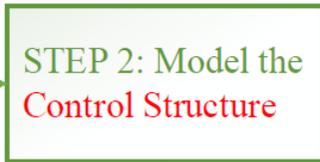

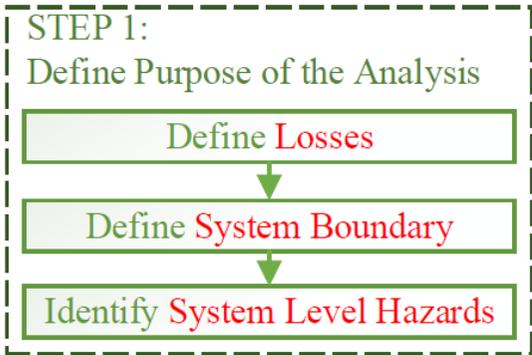

Why STPA?

Why STPA?

- With the top-down nature of STPA, results identified from STPA will directly contribute to the improvement of the responses to the pandemic.
- During initial phases of COVID-19 pandemic, available information regarding the responses from public and governments were very limited. This is enough for the start of STPA.
- STPA identifies a diverse range of causal scenarios, including flawed process, processing delays, communication issues, conflicted controls, misinterpreted feedbacks, which can be easily overlooked especially in a socio-technical system.

- What could worsen the spread of virus?
- What could cause the economic depression?

- How could it happen?
- How to prevent it?

Iterations of the process to explore UCAs from Control Structures at progressive levels of details

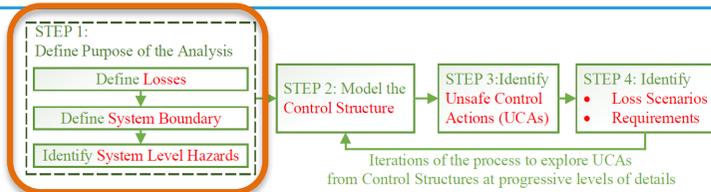

Step 1: Define Purposes of the Analysis

- Define Losses

Losses	
L-1	Loss of human life / damage to health and wellbeing (e.g. long term concerns with COVID)
L-2	Loss of economic stability (e.g. closure of business / increases in unemployment, decrease in purchasing power)
L-3	Loss of functioning democratic society (e.g. loss of freedom, human right .etc.)

- Define System Boundary

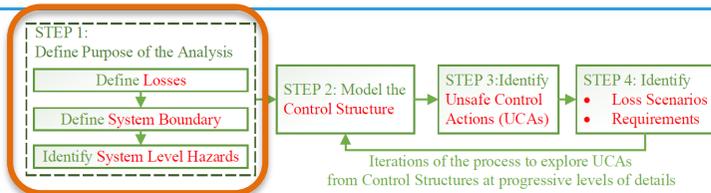

- System Boundary:** International interactions between different governments and W.H.O
- Analysis Boundary:** National-level responses to the COVID-19 pandemic

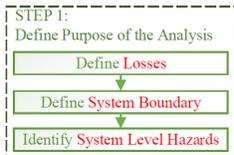

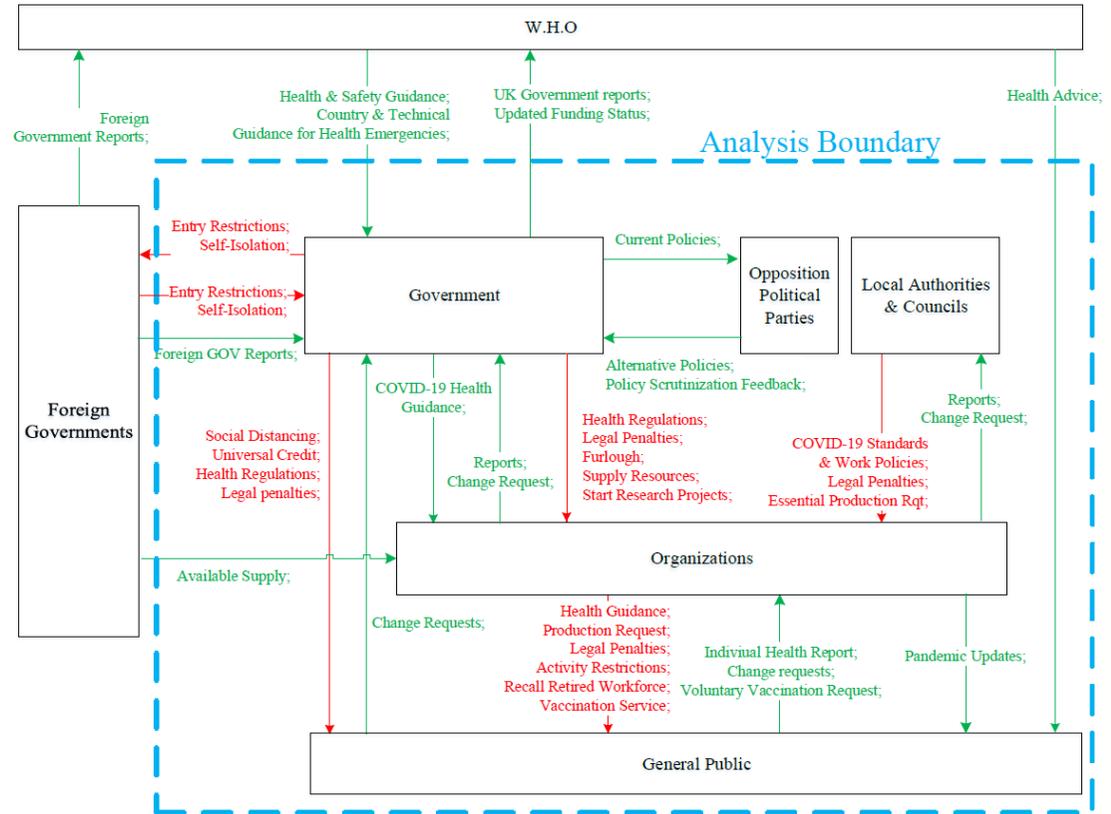

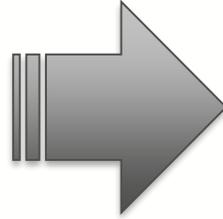

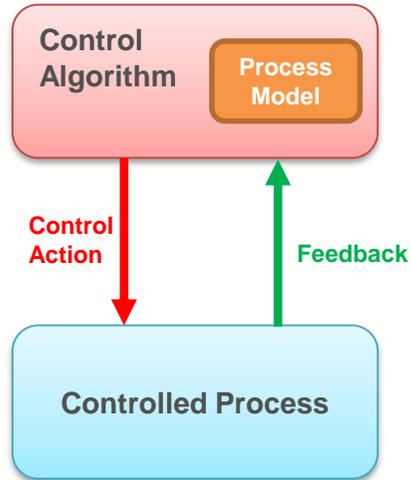

Step 1: Define Purposes of the Analysis

- Identify System-level Hazards (i.e. National-level)

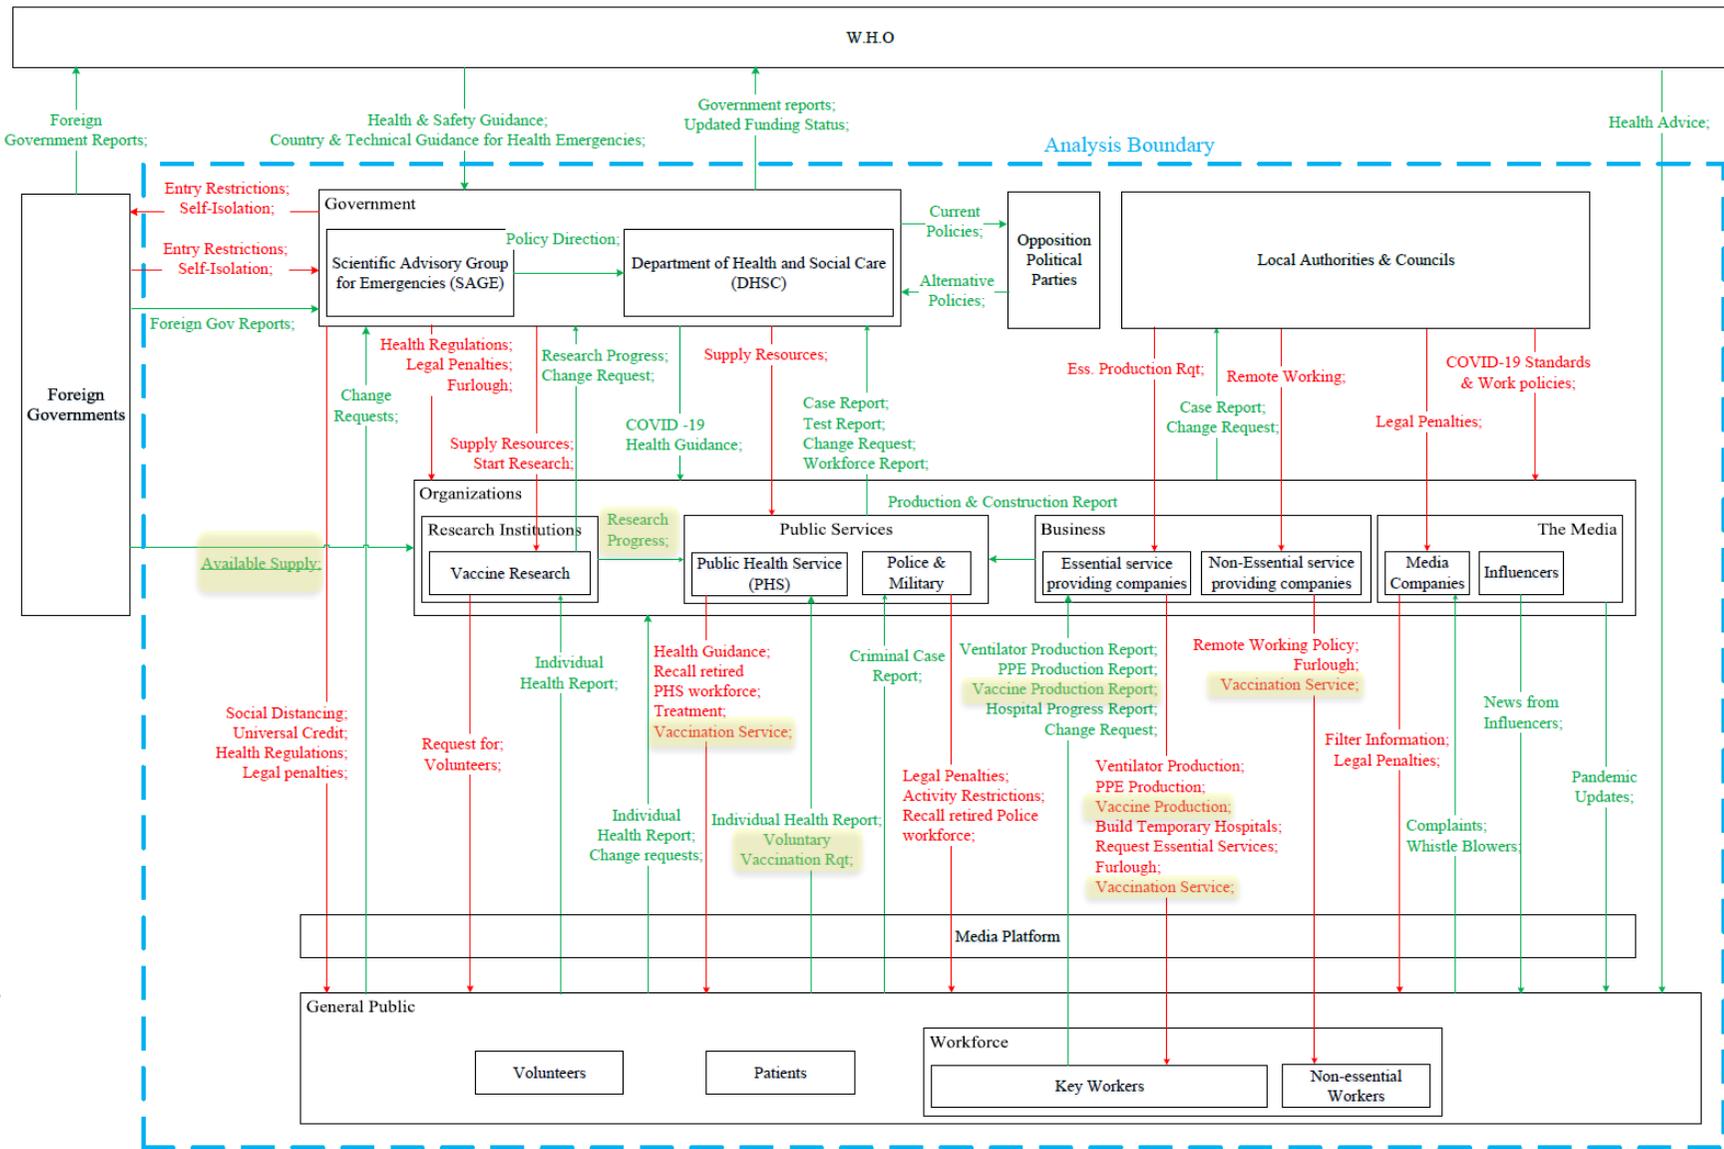

System-Level Hazards		
H-1	The population has an increase in infected cases	L-1,2
H-2	Inability of companies / organizations to operate normally	L-2
H-3	Overwhelming health system in the nation	L-1
H-4	Lack of essential supply in the nation	L-1,2,3
H-5	Social unrest in the nation	L-1,2
H-6	Discriminations in the nation	L-1,2,3

Results – Step 2: Model the Control Structure

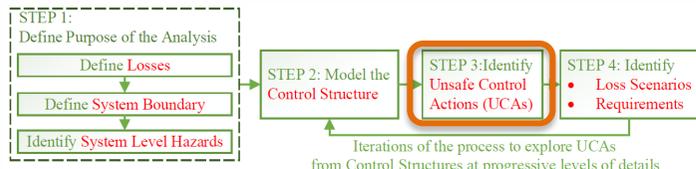

Iterations of the process to explore UCAs from Control Structures at progressive levels of details

Step 3: Identify UCAs

CA	Type	UCA
Vaccination Service (from PHS to Public)	Not Provided	UCA-1.1: Vaccination Service is not provided when $R > 1$ and there are no effective therapies for the coronavirus. [H-1,3,5]
	Provided incorrectly / when not needed	UCA-2.1: Vaccination Service is provided to people with a severe allergic reaction. [H-1,5]
		UCA-2.2: Vaccination Service is provided incorrectly (e.g. inadequate arrangement of the procedure, no social distancing etc.) when there is a large amount of people attending the vaccination appointment. [H-1, 3]
	Provided too Early / too Late	UCA-3.1: Vaccination Service is provided too early when the vaccinee has just had the first dose (< 2weeks ago). [H-5]
		UCA-3.2: Vaccination Service is provided too late when the vaccinee has already had the first dose (> 12 weeks ago). [H-1,3,5]
Provided too Long / too Short	UCA-4.1: Vaccination Service is suspended too soon when <70% of the population has been vaccinated. [H-1,3,5]	

System-Level Hazards		
H-1	The population has an increase in infected cases	L-1,2
H-2	Inability of companies / organizations to operate normally	L-2
H-3	Overwhelming health system in the nation	L-1
H-4	Lack of essential supply in the nation	L-1,2,3
H-5	Social unrest in the nation	L-1,2
H-6	Discriminations in the nation	L-1,2,3

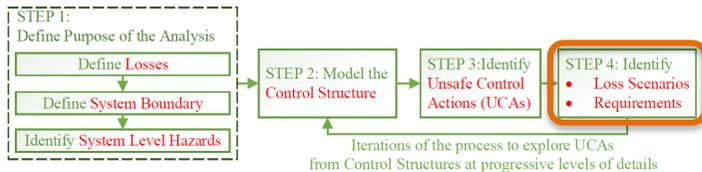

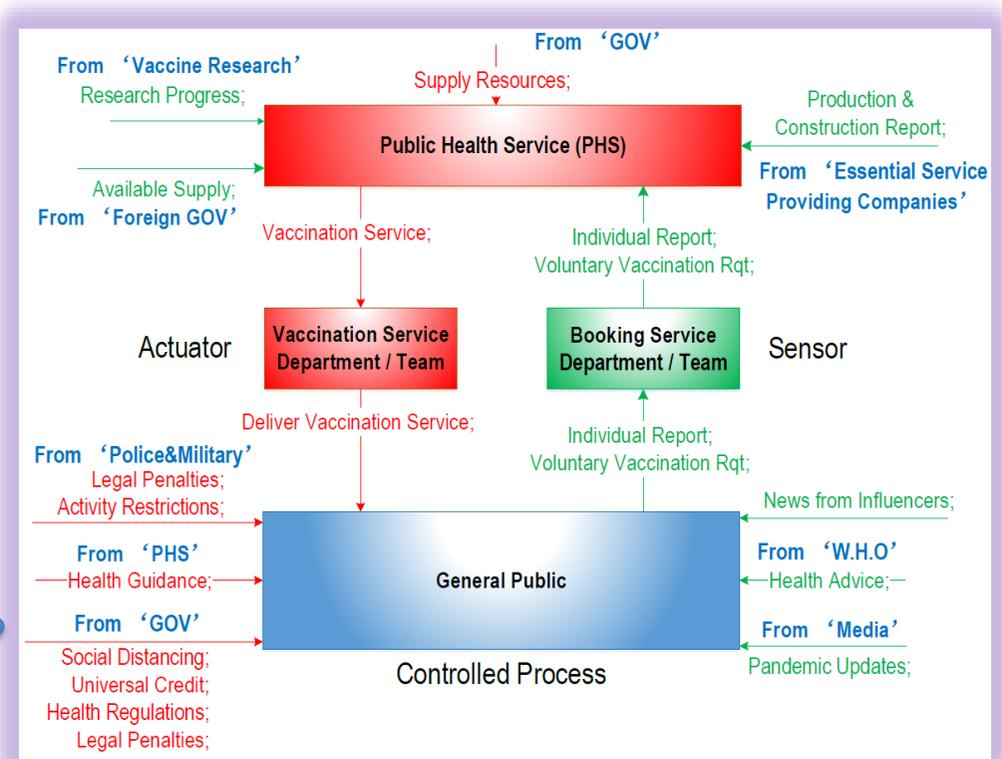

Step 4: Identify Loss Scenarios & Requirements

Two UCAs to be discussed in this presentation:

UCA-1.1: Vaccination Service is not provided when $R > 1$ and there are no effective therapies for the coronavirus. [H-1,3,5]

UCA-2.1: Vaccination Service is provided to people with a severe allergic reaction. [H-1,5]

Observing the Control Loop, there can be many factors leading to the Vaccination Service not delivered / incorrectly delivered, which can be easily neglected.....

Step 4: Identify Loss Scenarios & Requirements

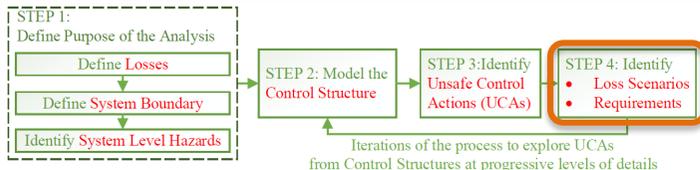

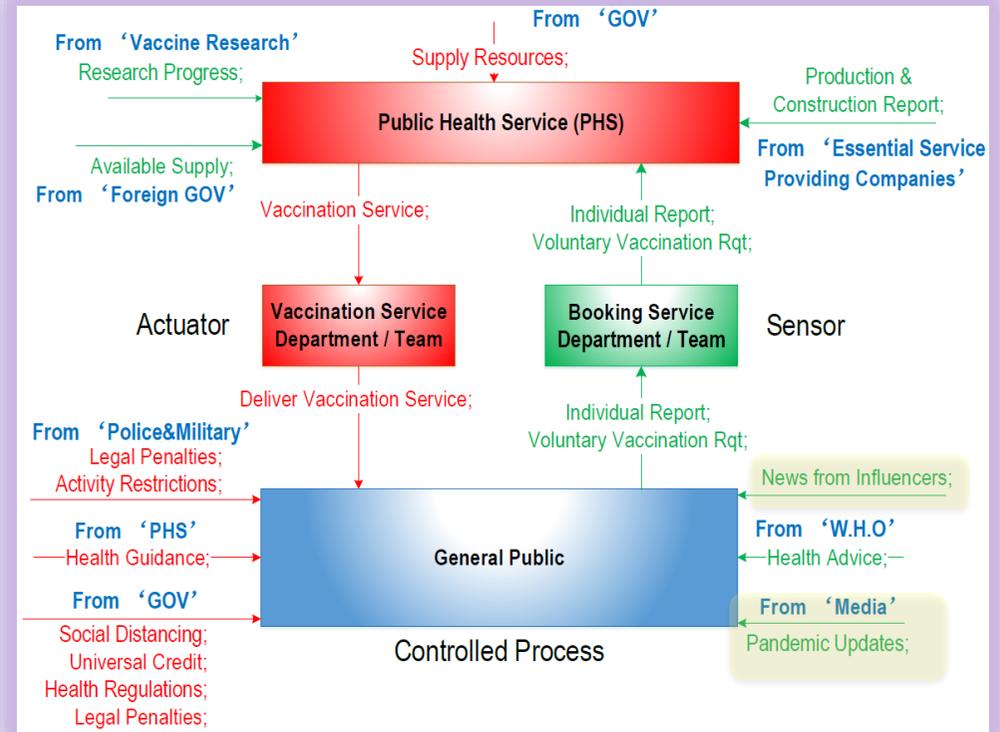

UCA-1.1: Vaccination Service is not provided when $R > 1$ and there are no effective therapies for the coronavirus. [H-1,3,5]

Loss Scenario-1 for UCA-1.1:

Vaccination Service was available to the eligible group of the public, however, due to the **outdated 'Pandemic Updates' from 'Media' / inadequate information from Influencers** (e.g. incorrect descriptions of the side effects after vaccination, outdated announcement of eligible age group for the vaccine .etc), people decided not to take the vaccine.

Proposed Requirements for LS_1:

- The information of **eligible population group** for vaccination must be up-to-date.
- Information regarding **possible side effects** of different types of vaccine must be as **true and objective** as possible.
- Media Companies must **filter out news** which are incorrect and misleading.

Step 4: Identify Loss Scenarios & Requirements

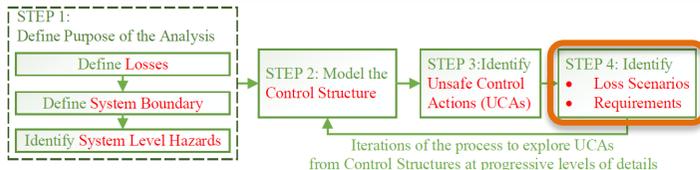

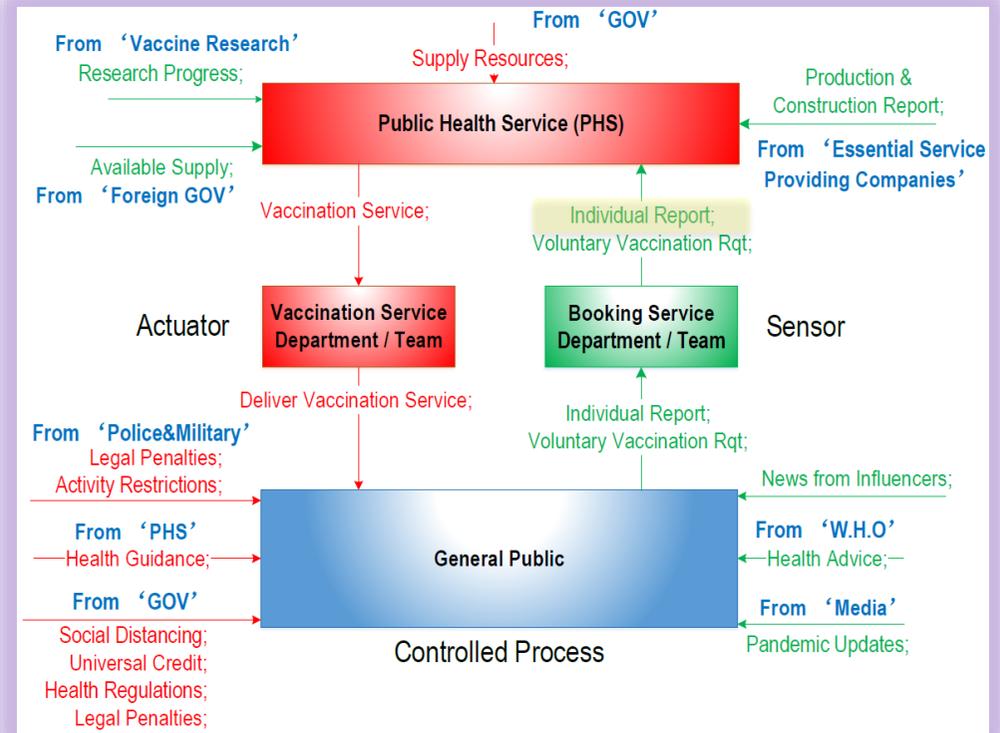

UCA-2.1: Vaccination Service is provided to people with a severe allergic reaction. [H-1,5]

Loss Scenario-1 for UCA-2.1:

PHS was incorrectly believing that the patient has no allergic reaction as they were referring to the **'Individual Report'** from the patient to understand their health status and medical history. However, due to the **incomplete / incorrect information recorded in the report**, the member of PHS serving the patient incorrectly confirmed that the patient was eligible for the vaccine.

Proposed Requirements for LS-1:

- 'PHS' must ensure that **more clear guidance are provided to the patient** to guide them to correctly describe their health status and medical history.
- 'PHS' must also refer to the patient's report **recorded in the database** rather than only rely on verbal communication with the patient to determine their health status / medical history.

Step 4: Identify Loss Scenarios & Requirements

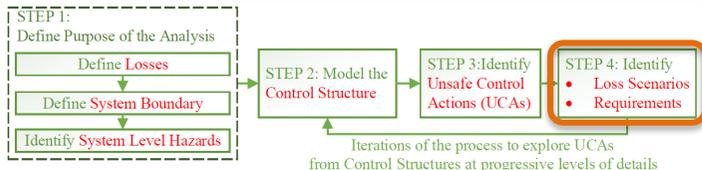

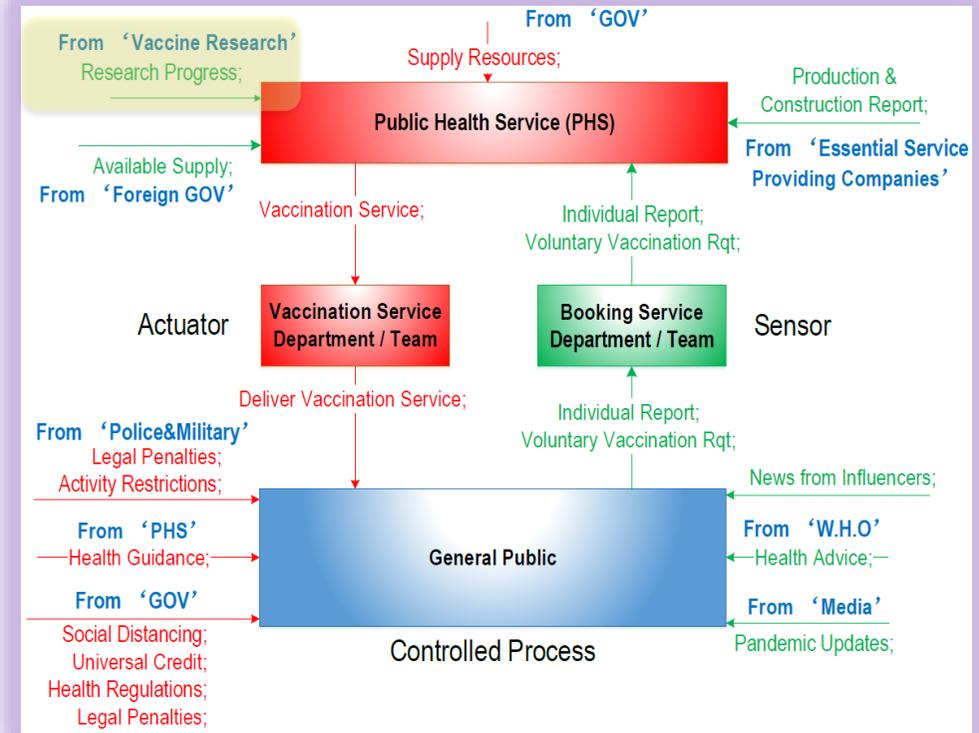

UCA-2.1: Vaccination Service is provided to people with a severe allergic reaction. [H-1,5]

Loss Scenario-2 for UCA-2.1:

PHS was incorrectly believing that patients with severe allergic reaction were also eligible to take the vaccine as they were referring to the '**Research Progress**' from the 'Vaccine Research'. However, due to the **outdated information** regarding the vaccine provided from the research institution, PHS' understanding of the vaccine was outdated. As a result, the vaccination service was provided to people with a severe allergic reaction.

Proposed Requirements for LS-2:

- When there is any update on the research / study of vaccines, the relevant research institution must ensure that the **updated information is delivered to the PHS**.
- Relevant member of PHS must **frequently get in touch** with the vaccine research institution to identify the latest status of the research.

Key Findings

Key findings from the analysis:

- Public can obtain information from various paths (e.g. from social media, newspaper), whose truth cannot be guaranteed. It is therefore suggested from the analysis that relevant stakeholders shall **guide the public to identify information from authoritative / evidence-based sources (e.g. official GOV / PHS website).**
- It is common that patients are not clear about their medical history / symptoms. It is therefore suggested from the analysis that PHS shall provide a **clear guidance to patients to enable them to understand how to identify the symptoms.**

Summary

In the whole analysis, we:

- Analysed 37 CAs
- Identified 236 UCAs
- Identified 1440 Loss Scenarios
- Proposed 2880 Requirements
